Business Summary

In partnership with local nurseries and a manufacturing company, we are developing new routes to generic pharmaceuticals.

1. The Opportunity

As pharmaceuticals come 'off-patent', generic suppliers are developing new synthetic routes to provide a competitive advantage. Brock's research in plant metabolism provides us with a unique understanding of the use of plants as chemical factories.

2. The first solution

Galanthamine is our first product. Daffodils have been planted and harvested. Extraction processes are being developed.

3. Revenue Model

We partner to provide vertically integrated solutions to the retailer

4. Target Market

Healthcare markets in North America

5. Competitive Advantage

Working with professors in the Advanced Biomanufacturing Centre at Brock, we conduct research, develop and patent technologies that provide a cost advantage to approved pharmaceuticals

6. Milestones for the next year

In 2013:

We have harvested our first crop.

Are in discussions with GMP providers
